ABSTRACT

A preferred embodiment of the invention is directed to a garment for controlling odors and, more specifically, to a hunting garment for both reducing and masking body odors or other scents emitted by hunters. In a preferred embodiment, the garment is an undergarment shaped to fit around the pelvic region of a person wearing the garment, similar to boxer shorts or briefs. The undergarment is comprised of constricting elements around the waist and legs to create a barrier to air flow through the openings for the waist and legs. The undergarment further comprises odor control areas located at the front and rear areas of the garment. The odor control areas contain an amount of an odor-reducing agent for adsorbing odors emanating from the body of the hunter. The undergarment further comprises a masking scent incorporated into the fabric of the garment in order to mask any odors that may escape into the surrounding environment.
